- Right click with Shift on platform tools
- Open Powershell window
- Attach cellphone with usb debugging on
- ./adb devices to check that device is recognized
- ./adb shell to turn on adb shell environment
- pm list packages lists all the packages on the phone
- pm list packages | grep ‘amazon’ list all the packages with the word amazon
- pm uninstall --user 0 com.android.chrome uninstalls chrome app for main user (completely if only one user)
- pm disable com.android.packageinstaller disables package installer so that you cant download apks and install them (might be called com.google.android.packageinstaller sometimes)
- pm enable com.android.packageinstaller reenables package installer (might be called com.google.android.packageinstaller sometimes)
- pm uninstall -k --user 0 com.android.settings.<settingName> removes setting options (but dont use it I havent figured out yet how to reinstall it)

https://adbshell.com/ site with full adb commands
https://developer.android.com/reference/android/provider/Settings.html site with full android settings

To reinstall google play download to phone the com.android.vending.apk and click on it to install it assuming that packageinstaller is enabled
Older android operating systems like 4.4 wont let you uninstall or disable nor do they have multi users so you need to use the pm block command
To undo it you need to use the unblock command

If having trouble reinstalling a program then it might not actually be completely uninstalled it might only be uninstalled for a specific user or it might just be disabled or just blocked in order to install will need to either uninstall first or unblock or enable
